Patent No. US20020164588A1

GENERAL INFORMATION:

APPLICANT: Elsenberg, David

APPLICANT: Elsenberg, David

APPLICANT: Elsenberg, Edward M.

TITLE OF INVENTION: DETERMINING THE FUNCTIONS AND

TITLE OF INVENTION: INTERATIONS OF PROTEINS BY COMPARATIVE ANALYSIS

FILE REFERENCE: 07419-032001

CURRENT APPLICATION NUMBER: US/09/712,363

CURRENT PILING DATE: 2000-11-13

PRIOR APPLICATION NUMBER: PCT/US00/02246

This clone is from an A. gambiae BAC library (ND-TAM) provided by
This clone is from an A. gambiae BAC library (ND-TAM) provided by
F.H. Collins and sequenced by The Institute for Genomic Research
(TIGR). The BAC library was generated from A. gambiae PEST strain
DNA. All DNA was extracted from newly hatched first instar larvae
to minimize the inclusion of DNA from microorganisms that inhabit
the gut. The DNA is derived from mixed sexes of larvae. The BAC
library was constructed at Texas A&M Universty BAC Center
University, College Station, Texas 77843-2123, USA using a HindIII
Seq primer: MI3 Rev
Class: BAC ends.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A backbone of the vector is basically from pBluescript(KS), that was in vivo excised from a modified lPs phage vector (Mo bl rec, was in vivo excised from a modified lPs phage vector (Mo bl rec, Germany). 5' end of the cDNA that was digested with XhoI was ligated to Sall site of the vector and the 3' end including polya tail was ligated to BamHI site of the vector. CDNA instert could be amplified with conventional T7 and T3 primers. This full-length described in The Plant J 15, 707-720 (1998) Seki M. et al.

Protonemata were blended by the POLYTRON, and then cultivated on the BCDATG medium for 13-14 days under the continuous light.

This GSS is part of a random genomic sequencing program of thirteen yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces
exiguus, Saccharomyces servazzii, Zygosaccharomyces rouxii,
Saccharomyces kluyverimyces thermotolerans, Kluyveromyces
lactis var. lactis, Kluyveromyces marxianus, var. marxianus, Pichia angusta, Debaryomyces hansenli var. hansenli, Pichia sorbitophila,
Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to
5 kb were prepared and both extremities were sequenced. See
keywords for description of this sequence and for the sequence of
the other extremity of this insert.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CNSO70MR 965 bp DNA linear GSS 06-JUL-2001 T3 end of clone AZ0AA010F07 of library AZ0AA from strain CBS 712 of Kluyveromyces marxianus, genomic survey sequence.

seqrefégenoscope.cns.fr - Web: www.genoscope.cns.fr)
This GSS is part of a random genomic sequencing program of thirteen
yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces
exiguus, Saccharomyces servazzil, Zygosaccharomyces rouxil,
Saccharomyces kluyveromyces thermotolerans, Kluyveromyces
lactis var. lactis, Kluyveromyces marxianus var. marxianus, Pichia
angusta, Debaryomyces hansenii var. hansenii, Pichia sorbitophila,
Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to
5 kb were prepared and both extremities were sequenced. See
keywords for description of this sequence and for the sequence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ||||||| ::: ||||:::||| ||||:::

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This clone is from an A. gambiae BAC library (ND-TAM) provided by F.H. Collins and sequenced by The Institute for Genomic Research (TIGR). The BAC library was generated from A. gambiae PEST strain DNA. All DNA was extracted from neally hatched first instar larvae to minimize the inclusion of DNA from microorganisms that inhabit the gut. The DNA is derived from mixed sexes of larvae. The BAC library was constructed at Texas A&M University BAC Center University, College Station, Texas 77843-2123, USA using a Hindili
                                                                                                                                                                                                                   Leu-ArgGluProValAlaArgPheCys-ArgAlaValValLeuLeuGlyArgAspAlaG 383

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This clone is from an A. gambiae BAC library (ND-TAM) provided by Fr.H. Collins and sequenced by The Institute for Genomic Research (TIGR). The BAC library was generated from A. gambiae PEST strain DNA. All DNA was extracted from newly hatched first instar larvae to minimize the inclusion of DNA from mixed sexes of larvae. The BAC library was constructed at Texas A&W University BAC Center University, College Station, Texas 77843-2123, USA using a HindIII

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Óγ
                                                                                                                                                                                                                               This clone is from an A. gambiae BAC library (ND-TAM) provided by FH. Collins and sequenced by The Institute for Genomic Research. (TIGR). The BAC library was generated from A. gambiae PEST strain DNA. All DNA was extracted from newly, hatched first instar larvae to minimize the inclusion of DNA from microorganisms that inhabit the gut. The DNA is derived from mixed sexes of larvae. The BAC library was constructed at Texas A&M Universty BAC Center University, College Station, Texas 77843-2123, USA using a HindIII
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                273

NL_4_N22 Drought stress (leaf) Oryza sativa (indica cultivar-group) CDNA clone NL_4_N22 3', mRNA sequence.
B1306480
B1306480.1 G1:14981802
EST.
Equal amounts of plasmid DNA from three normalized libraries (fetal lung NbH119W, testis NHT, and B-cell NCI_CGAP_CGB1) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as vitracer in a subtractive hybridization reaction. The driver was PCR-amplified CDNAAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of 1.M.A.G.E. clones 297480-030287, 682632-687239, 526408-728711, and 72906-731399, subtraction by Bento Soares and M. Fatima Bonaldo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1. .501.
